

## **Hubleap Technologies Hackathon-keylogger**

### **Team Members**

**Petrus Haixula**

**Jayson Hanabeb**

**Tomas Niikondo**

### **Project Description**

The system we created is a python keylogger that logs all of a user's keyboard inputs and sends them to a discord server via discord webhooks. When the exe/setup is executed, the program runs silently in the background and logs all of the user's key inputs. And can then be transferred to host computers for installation using USB flash drives.

### **The solution**

One solution is for users to update to the most recent version of Windows. Some users may be running an older version of Windows with anti-virus software that is no longer up to date. Users should also check that their anti-virus software is up and running. The keylogger will be detected and stopped by anti-virus
